

NutraMicro

Weaning diet

NutraMicro is a weaning microdiet for marine fish larvae. Its bridging the gap between live feed such as *Artemia* and grow out diets (>1mm).

The diet is semi-moist (~30% moist) and manufactured as small crumbles at several sizes (200µm – 1mm). The diet is stable in the water for 24 hours with minimum leaching and will not break down.

NutraMicro diets are solely based on dry meals without any fresh or frozen products. They are pathogen free with a shelf life of 6 months (refrigerated) or 24 months (frozen).

Herbal extracts (*NutraGreen*®) are incorporated into the diets. These 100% natural additives aimed at improving larvae performances through boosting the immune system and digestive system. Due to the fact that the diets are semi-moist, they are easier to digest by the larvae compared to standard dry weaning diets. Moreover, the diets contain easy to digest proteins and peptides, as well as marine hydrolysates.

NutraMicro can be ‘tailor-made’ to species and nutritional requirements such as; EPA, DHA and AA, vitamins etc.

Typical Analysis (% DW, may vary according to requirements):

Protein	50-60
Lipids	16-22
Ash	6-8
Moist	30-35

The diet contains marine organisms meals and hydrolysates, oils, vitamins, minerals, immune stimulants, carotenoids, binders, herbal extracts and natural preservatives.

No fresh ingredients are included.
